

# Meter lets customers

## measure appliance load:

CableOrganizer.com is touting a gadget that customers can use to track where their power is being used and thus do something about it.

The Watts up? electrical watt meter attaches to any 120 volt electric device to track how much it costs

to run. The meters themselves cost between \$72 and \$195 and connect

to a computer to give customers the real cost of the equipment they run in their homes or businesses

based on local power rates (<http://cableorganizer.com/electricity-power-meter/?term=meter>).
